## **DETAILED ACTION**

### ***Allowable Subject Matter***

The following is an examiner's statement of reasons for allowance: As per claims 1, 7 and 10 the closest prior art of record Epstein U.S. Patent 6,453,416 and Naccache U.S. Patent 5,910,989 taken either individually or in combination with other prior art of record fails to teach or suggest responding to the merchant request with a specific data string having a header, where the header includes a request for a digital signature to be appended to the data string.

Epstein describes providing a secure proxy-signing device to form digital signatures, which are supplied over an insecure network. Epstein further describes forming a digital signature of a document using a private key stored within the signing device and data items supplied to the signing device from which a document hash is derived and authenticated within the signing device. Epstein still further describes encrypting the document hash with the private key to form the digital signature only if the document hash has been authenticated. Naccache describes a method for generating digital signatures for electronic messages, and is directed to enabling smart cards with reduced calculation and storage resources to produce digital signatures with a high degree of security in spite of their reduced resources. Naccache further describes sending a generated digital signature to a verifier device or terminal in which a smart card has been inserted.

However, neither Epstein nor Naccache, alone or in combination, disclose responding to the merchant request with a specific data string having a header, where the header includes a request for a digital signature to be appended to the data string.

Specifically, Epstein does not disclose responding with a specific data string. Instead, Epstein discloses that a the blank document Do (which may be integrated in (a Java applet " is transmitted. However, this blank document does not contain a specific data string. Instead, as its description implies, it is simply a blank document that lacks a specific data string. Moreover, there is no disclosure that the blank document disclosed in Epstein has a header that includes a request for a digital signature to be appended to the data string. Instead, Epstein merely discloses that the blank document sent to the user is filled out and approved by the user and then sent to a server. Naccache likewise fails to disclose use of the claims specific data string" or "header."

The specific allowable feature, which distinguishes the present invention over the prior art is responding to the merchant request with a specific data string having a header, where the header includes a request for a digital signature to be appended to the data string.

Claims 2 -6 and 11, and 8-9, are dependent upon Claims 1 and 7 respectively and thus have all the limitations of claim 1 and 7 respectively and are allowable for that reason.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably
